Analysis.

TheGradCafe Scraped Data Analysis Dashboard

Pull Data

Update Analysis

Runs the web scraper to safely pull and load new data into the database.

Refreshes the page to show the most up-to-date analysis. Will not execute if a scrape is active.

1. How many entries do you have in your database who have applied for Fall 2026?

Answer: Applicant count: 30640

2. What percentage of entries are from International students (not American or Other) (to two decimal places)?

Answer: Percent International: 47.02%

3. What is the average GPA, GRE, GRE V, GRE AW of applicants who provided these metrics?

Answer: Average GPA: 3.78, Average GRE Quant: 165.4, Average GRE Verbal: 161.1, Average GRE AW: 4.4

4. What is the average GPA of American students in Fall 2026?

Answer: Average GPA American: 3.79

5. What percent of entries for Fall 2026 are Acceptances (to two decimal places)?

Answer: Acceptance percent: 36.73%

6. What is the average GPA of applicants who applied for Fall 2026 who applied for Acceptances?

Answer: Average GPA Acceptance: 3.76

Docker hub

<https://hub.docker.com/repositories/eddieperri>

Make sure Docker Desktop is installed and running.

Open module_6 in the terminal

- Download the images:

```
docker pull eddieperri/module_6-web
```

```
docker pull eddieperri/module_6-worker
```

- Start the project:

```
docker compose up -d
```

Open the flask web page at <http://localhost:8080>

Go to the RabbitMQ dashboard at <http://localhost:15672> (enter “guest” as the username and password if required)

If you click a button on the flask website, you can see that request pass through the RabbitMQ dashboard

Architecture

The project is split into four separate parts:

- **Web (Flask):** The website handles user clicks but no longer does any heavy data processing itself.
- **Worker (Python):** The background helper. It does all the scraping and updating
- **RabbitMQ:** This part receives and holds tasks from the website until the Worker is ready to do them.
- **Database (PostgreSQL):** Where the data is safely stored. It uses a Docker volume so your data isn't lost if the containers restart. The database automatically loads the starting data from our JSON files to give it some “seed data.”
